

If you're using Specman GUI to run simulations you must have encountered this rather annoying feature before - When running several simulations during the same session, specman doesn't clear the log file by default so what you get in the end is a concatenation of all log files which makes it kind of - how to put it nicely - useless.

Ok, now try adding this to your `e` testbench (the top most `e` file)

```
extend global {  
  setup_test() is also {  
    specman(set log off);  
    specman(set log specman.elog);  
  };  
};
```

Voila!
